

Case: PRD for Downstream Logistics Optimization System

Scenario

KPN Corp's downstream logistics currently relies heavily on Excel and manual tracking. Traders, logistics operations, and admin teams each maintain separate spreadsheets for:

- Shipment schedules
- Truck/ship movements
- Loading/unloading data
- Product quantity gain/loss
- Quality deviation reports

There's **no single source of truth** and **no visibility for management** across locations. Finance and commercial teams also face **delays** in getting accurate logistics data for payment, reconciliation, and performance monitoring.

Your Task

As the **Senior Product Manager**, create a **Product Requirement Document (PRD)** for a web-based system to digitalize and optimize downstream logistics tracking.

Your PRD should include:

1. **Problem Statement & Business Objectives** — Describe the current pain points and measurable goals.
2. **Target Users & Roles** — e.g. Trader, Logistics Operator, Admin, Management.
3. **High-Level Process Flow** — show the end-to-end flow from shipment planning to delivery confirmation.
4. **Feature List & User Stories** — with examples of key modules such as:
 - Shipment Planning & Tracking
 - Contract-to-Delivery Linkage
 - Real-Time Dashboard
 - Data Reconciliation (Quantity, Quality, Cost)

5. **Integration Points** — with SAP (read-only), external files, or sensors if applicable.
6. **KPIs & Success Metrics** — define how success will be measured.
7. **AI Opportunities (Bonus)** — suggest how AI can help (e.g., anomaly detection, ETA prediction, cost optimization).
8. **Out of Scope & Assumptions** — clarify what's excluded and your assumptions while building this PRD

Downstream Logistics Digitalization Platform

1. Problem & business objective:

Problem

- Data logistik tersebar dibanyak excel per tim, sehingga ada kemungkinan perbedaan data antara tim.
- Jadwal pengiriman & selisih kuantitas dicatat manual, memungkinkan adanya salah input data ataupun duplikasi data.
- Finance & commercial terlambat menerima data akurat, sehingga pembayaran & pencatatan invoice tertunda.
- Management tidak memiliki visibilitas terhadap apa yang terjadi secara real time.

Goals

- Mengurangi input data menggunakan excel dan duplikasi data
- Finance dapat mendapatkan data lebih cepat dan akurat
- Menyediakan visibilitas secara real time

2. Target Users & Roles:

- As a Trader, I want to create a shipment plan linked to a sales contract
- As a Logistics Operation, I want to update the truck/ship departure time and track the shipment
- As a Finance, I want to have accurate data to process payments
- As a Management, I want to see real-time dashboard and export the report
- As a Admin, I want to manage user account and certain master data

3. High-Level Process Flow

4. Feature List & User Stories

Epic: Shipment Planning

- As a system, I can and sync capture data contract from SAP
- As a Trader, I can create a shipment planning base on the sales contract
- As a Logistic Operation, I can input the transport type and departure time

Epic: Tracking shipping

- As a user, I can track in real time the shipment so I can prepare for a delay

Epic: Loading/Unloading

- As a Logistic Operation, I can input volume that we send
- As a Logistic Operation, I can input volume that we receive
- As a system, I can mark the contract as having been sent and ready to be invoiced

Epic: Quantity Gain/Loss

- As a system, I can reconcile how many gain or loss products

Epic: Dashboard Real-Time

- As a Management, I can know in real time the shipment plan and delays

5. Integration Points

- SAP: untuk kebutuhan pengambilan data kontrak, data master (product / customer name). Jenis integrasi by API atau SFTP
- GPS / IoT : Tracking posisi kendaraan dan ETA

6. KPI & Success Metrics

KPI	Target
Pengiriman tercatat digital	> 90%
Penggunaan manual excel	< 10%
Waktu rekonsiliasi data	< 1 jam

7. AI Opportunities

Optimisasi cost menggunakan AI dapat membantu dengan contoh use case, AI memberikan rekomendasi rute dengan mempertimbangkan cuaca, real time traffic, data historikal pengiriman (meliputi rute, biaya, dan waktu tempuh). Dengan data data berikut AI dapat merekomendasikan jalur untuk mengoptimisasi biaya pengiriman.

8. Out of Scope & Assumptions

Out of scope:

- Perhitungan lembur, absensi sopir
- Aplikasi versi mobile app

Asumsi:

- Semua lokasi memiliki internet
- Pembuatan kontrak dan invoice berada di-SAP
- Logistik tidak menggunakan vendor
